SUMMARY

Senior Software Engineer and Tech Lead with **10+** years building full-stack products and cloud infrastructure across start-ups and consultancies. Architects **AI-powered** platforms and scalable **AWS** infrastructure (**Kubernetes**, **Terraform**, **microservices**) for **20+** enterprise customers, and leads teams that ship without trading away quality. **Leads by example** rather than instruction: **working agreements** turned into tooling, and a colleague **mentored** from no technical background to a developer role over **two years**. At home on the business side of the table too — technical **pre-sales**, architecture costing, **feasibility** calls that hold. Remote-first, with distributed teams across Europe.

WORK EXPERIENCE

Senior Software Engineer — Epicode

Jan 2026 – Present

Remote · Freelance

Building **AI-powered** products for education and professional development.

- Designed and built LinkedOut, an AI-powered skill-assessment platform (**Next.js**, **Express.js**, **OpenAI API**) that evaluates professionals' CVs against future job-market trends and identifies skill gaps — **sole owner** of the technical choices, from stack to model selection, and from empty repository to launch in **one week**. Used by **over 2,000** candidates as the centrepiece of a national Labour Day campaign.
- Developed MicroLearn, an interactive microlearning platform delivering personalized learning experiences to **close to 10,000** learners across **roughly 100** companies.

Tech Lead — Greenovation

Oct 2025 – Present

Remote · Freelance

Technical lead for web-based energy-efficiency simulation products.

- Architected and delivered energy-efficiency simulation tools that replace the spreadsheets Enel's field teams used to price energy renovation and investment offers by hand; the public-facing simulators put the same model in front of homeowners looking to cut their operational costs.
- Own every frontend decision for a **three-person product team**, working with design on the shared component system and with the **product owner** on the business logic each simulator encodes.
- Designed a composable framework from scratch that standardizes simulator development, cutting the time needed to build a new domain-specific simulator by **50%**.
- Built **three vertical simulators** from scratch — climate, boilers, and home EV charging — alongside the inherited legacy one, all sharing a **monorepo**, a **design system**, and a common component set (**React**, Next.js, **TypeScript**).

Cloud & Integration Architect — Spindox Labs - Ublique

Jan 2023 – Nov 2025

Remote

Architected and managed technical infrastructure for the Ublique AI-driven decision-intelligence platform.

- Represented the technical team in **pre-sales**: ran **technical demos**, sized and priced target architectures with **AWS** cost tooling, and wrote **the technical half of the proposal** — the solution, and which of the customer's problems it removed. Contributed to a **25%** increase in successful deals, and said no when a proposed timeline did not match the estimate rather than let an undeliverable commitment into the contract.
- Turned customer **onboarding** from a conversation into a process: a standard **requirements template** with room for the unforeseen, so the delivery team received a clear brief whether or not I was in the room. **Onboarded 50+** customers.
- Proposed and ran a monthly cloud **cost-optimization** programme across every customer whose AWS infrastructure we managed: **rightsizing** over-provisioned resources, scheduling environments to shut down when nobody needed them, and building an in-house app that attributed spend to projects and customers through AWS tags so managers could allocate it. Cut **cloud spend** by **25%**, reported back to management.

- Made the case for **Infrastructure as Code** on a Poste Italiane engagement and won it: **Terraform** and **Ansible** replaced hand-built environments across the machine fleet on Azure, and standing up one environment from another stopped being a manual job.
- Contributed the technical material for the **Gartner** briefing behind Ublique's listing in the 2024 Market Guide.
- Designed scalable cloud infrastructure using **microservices** architecture, Terraform, and **Kubernetes** on AWS, improving system reliability by **40%** and **halving** infrastructure incidents.
- Ran the infrastructure of **20+** enterprise customers — **three environments** each (development, staging, production), **ten or more microservices** per environment — on **Docker** Compose, Portainer, and Kubernetes, with standardized Ansible playbook templates keeping deployment and development workflows consistent across all of them.
- Collaborated with AI/ML teams to architect robust software and hardware infrastructures, enabling seamless integration of machine learning models.
- Engineered efficient data-integration patterns that accelerated customer data onboarding.

Tech Team Lead — Spindox Labs - Ublique Jan 2022 – Jan 2023

Remote

Owned the core of the Ublique platform (**Java** microservices) and the tooling around it.

- **Led a team of four** in-house engineers, and **hired** for it — **CV screening**, **technical interviews**, and the final call.
- Developed a set of **Gradle** plugins adopted by every project on the platform, cutting build boilerplate **by half** and giving every team one standard for shared-library use. The **working agreements** behind them were the team's own: the plugins made them automatic instead of imposed.
- Modelled the platform's business processes in **BPMN** and ran them on **Flowable**, embedded in the Java microservices, so long-running multi-step decision flows were declarative models rather than hard-coded logic — changing a process no longer meant redeploying bespoke code. **Five to ten** modelled processes per project, on an engine and a process editor I owned.
- Designed a new **CI/CD** pipeline and versioning system with **Jenkins**: a serial ten-minute build that blocked every other build and deploy became a parallel, Docker-optimized pipeline, cutting build time by **50%**.
- Created an integration system for third-party Artificial Intelligence algorithms, bringing advanced custom AI features into the Ublique platform — the BPMN model defined where each decision step plugged in, while a **RabbitMQ** messaging layer and the engine handled state, retries, and long-running execution. **Around 40** algorithms integrated across the project portfolio.

Fullstack Developer — Spindox Jan 2020 – Jan 2022

Hybrid

Worked across multiple company projects as part of a Chapter team.

- Led the adoption of the monorepo pattern for **Angular** projects: **10-15** applications and sub-projects consolidated in three months, including the public website of UBI Banca (now part of Intesa Sanpaolo).
- Migrated a legacy mobile application built on deprecated frameworks to an Ionic-based app, and designed new Azure Pipelines to manage its CI/CD.
- Built a reusable Angular component library adopted by all **three teams** — **around thirty developers** — delivering the customer's platform.
- Developed Cordova apps integrated with Microsoft Dynamics CRM data.

Mobile Developer — IOOOTA / Jarvis 2018 – 2020

Bologna, Italy

- Developed a smart-home mobile app (Cordova) performing energy analysis on business buildings.

Mobile Developer → Fullstack Developer — Horsa 2016 – 2020

Remote

- **Mentored** a colleague who arrived with no software background at all through to a working developer role, over **two years**: Git, JavaScript and **Angular 2+**, taught through **pair programming** once or twice a week, weekly **code reviews**, and dedicated projects we shipped together. An assignment from my manager, not a side activity.
- Early adopter of the Google Firebase platform and Cloud Run — shipped a Cloud Firestore-backed web application in 2017, the year Firestore launched.
- Developed mobile applications with Cordova and Ionic.

- Designed a custom rule engine (Java Drools) for employee satisfaction analysis, building the first MVP alongside a core Drools maintainer from Red Hat.

Fullstack Developer — Digitag 2015 – 2016
Milan, Italy
- Developed e-commerce software with WordPress and PrestaShop.
- Built tailor-made software for the art auction market, used live to run official auctions.

Fullstack Developer — Foowd 2013 – 2014
Remote · Freelance
- Created an e-commerce platform for social grocery buying based on the Elgg framework.

Frontend Developer — BigThink 2013 – 2014
Milan, Italy · Intern
- Developed AngularJS applications for the Facebook app market.
- Designed and contributed to the company framework for rapid delivery of full-stack applications (Laravel, AngularJS).

SKILLS

Team Leadership · Software Architecture · Agile · Technical Interviewing · Solution Design · Stakeholder Management · Estimation · Mentoring · Pair Programming · Code Review · Developer Onboarding · Technical Pre-Sales · Requirements Analysis · Cloud Cost Optimization · Microservices · OAuth · PostgreSQL · MySQL · SQL · AWS · Amazon ECS · Amazon EKS · AWS Lambda · Kubernetes · Terraform · Ansible · Docker · Podman · CI/CD · Jenkins · Azure Pipelines · Prometheus · Observability · Linux Administration · Git · Bash · OpenTelemetry · Azure AD · JavaScript · TypeScript · HTML5 · CSS · React · Angular · Next.js · RxJS · Tailwind CSS · Cypress · Playwright · Python · OpenAI API · Anthropic API · LLM · LLM Integration · Agentic Architectures · Node.js · Express.js · Bun · Java · Spring Boot · Micronaut · Maven · Gradle · Flowable · BPMN · REST APIs · Azure

LANGUAGES

Italian — Native · English — C1 — professional working proficiency

CERTIFICATIONS

- AWS Certified Cloud Practitioner — Amazon Web Services

EDUCATION

Bachelor's Degree in Computer Music Science 2007 – 2010
Università degli Studi di Milano

PROJECTS

cinepals — Creator

Stremio addon to swap movie & series recommendations with friends.

Technologies: TypeScript, Node.js

pytropolis — Creator

Python script execution via API in isolated virtual environments.

Technologies: Python, API
